

# The Workup: Report

The findings in this report are based on an exploration of salary data for manager level employees. The data explored correlations between salaries and age, industry, experience, gender, and education. The managers represent an almost equal number of men and women and a roughly even point spread across the four specified industries.

The data explored show a high correlation between years of industry experience and higher salaries as well as highest level of education and salary. Industry experience appears to present a stronger correlation overall than education, though in the technology industry a higher education seems to uniquely point to higher salary.

While both men and women were almost equally represented across industries, the data shows that each industry has a marked wage gap resulting in lower wages overall for female managers, despite similar industry experience and education.
